NEW NUTRACEUTICAL SUPPLEMENT PROVIDES SIMPLIFIED APPROACH TO DIABETES MANAGEMENT PROGRAMS

Less complicated

The introduction of **Diabatrol**[™], a promising new product, will come as a welcome relief to Type II diabetic and pre-diabetic patients who've experienced intense frustrations over the complications of caring for the disease and the discomfort of daily glucose management regimes.

A recent study, conducted by researchers at University of Chicago that included adult patients living with diabetes, highlighted the problems associated with diabetes care and the need for the elimination of some of its treatment complications. The daily diabetes management programs often prescribed were found to be complicated and difficult for many respondents. "An important minority of patients believe that comprehensive diabetes treatment programs have a significant impact on quality of life that is comparable to that of life with (diabetes) complications. We did not know that such a large proportion of patients would report this," reported lead author Dr. Elbert Huang to Reuters Health.

The product

The new product **Diabatrol**, a performance-proven nutraceutical supplement produced by Diabco Life Sciences in Carmel, Indiana, works by helping to reduce oxidative stress and insulin resistance, two key concerns for Type II diabetics and pre-diabetics. Not a prescription pharmaceutical, Diabatrol is a nutritionally balanced, gluten-free, low glycemic, hypoallergenic nutraceutical that contains more than 80 antioxidants from whole grain derivatives. Consuming Diabatrol is a simple act of opening a small pouch containing the water soluble product, mixing it with a favorite beverage, and consuming it twice a day. The desired result for patients is more balanced overall nutrition and a convenient, simplified approach to managing a blood glucose metabolism and helping reduce the complications associated with the daily routines of diabetes management. A typical diabetes patient often takes several medications each day, including two or three different pills to control blood sugar levels, one or two to lower cholesterol, two or more to reduce blood pressure and a daily aspirin to prevent blood clots.

Strong test results

The active ingredients in Diabatrol's proprietary formulation are whole grain derivatives that have been clinically tested and documented to lower blood glucose levels and reduce insulin resistance. In a 60-day, double-blind, randomized trial, which have been published in the Journal of Nutritional Biochemistry, the results were very promising: Type II diabetes test subjects realized an average 32.9 percent reduction (52 points) in fasting blood glucose levels. These results are comparable to many pharmaceutical drugs. In addition, an impressive secondary result included an 8 percent reduction in low-density lipoprotein (LDL), an important consideration for diabetic at-risk individuals concerned with high blood pressure and heart problems.

Diabatrol™

Encouraging news

Considering Diabatrol’s positive showing thus far in decreasing insulin resistance and providing a balanced level of overall nutrition, every indication is that this product provides a positive answer for a more simplified approach to the daily routines associated with diabetes management programs.

Diabco Life Sciences, LLC

The company’s mission is to provide effective nutraceutical supplements for consumers seeking performance proven non-prescription alternatives to help mitigate specific health risks. Diabco Life Sciences strives to combine advanced science, nutrition and good manufacturing practices to bring clinically tested and scientifically documented products to market for meeting the daily healthcare needs of individuals. More information about the company can be found at www.healthydiabetic.com, or by writing to Diabco Life Sciences, 484 East Carmel Drive, #204, Carmel, Indiana, 46032.
